THIENOPYRIDINE AND FUOPYRIDINE KINASE INHIBITORS

5

Technical Field

The present invention relates to compounds which are useful for inhibiting protein tyrosine kinases, methods of making the compounds, compositions containing the
10 compounds, and methods of treatment using the compounds.

Background of the Invention

Protein tyrosine kinases (PTKs) are enzymes which catalyse the phosphorylation of specific tyrosine residues in cellular proteins. This post-translational modification of these
15 substrate proteins, often enzymes themselves, acts as a molecular switch regulating cell proliferation, activation, or differentiation. Aberrant or excessive PTK activity has been observed in many disease states including benign and malignant proliferative disorders as well as diseases resulting from inappropriate activation of the immune system (e.g., autoimmune disorders), allograft rejection, and graft vs. host disease.

20 Endothelial-cell specific receptor PTKs such as KDR and Tie-2 mediate the angiogenic process, and are thus involved in supporting the progression of cancers and other diseases involving inappropriate vascularization (e.g., diabetic retinopathy, choroidal neovascularization due to age-related macular degeneration, psoriasis, arthritis, retinopathy of prematurity, and infantile hemangiomas).

25 The non-receptor tyrosine kinases represent a collection of cellular enzymes which lack extracellular and transmembrane sequences. At present, over twenty-four individual non-receptor tyrosine kinases, comprising eleven subfamilies (Src, Frk, Btk, Csk, Abl, Zap70, Fes/Fps, Fak, Jak, Ack and LIMK) have been identified. At present, the Src subfamily of non-receptor tyrosine kinases is comprised of the largest number of PTKs and includes Src,
30 Yes, Fyn, Lyn, Lck, Blk, Hck, Fgr and Yrk. The Src subfamily of enzymes has been linked to oncogenesis and immune responses.

The identification of effective small compounds which specifically inhibit signal transduction and cellular proliferation by modulating the activity of tyrosine kinases to

exudates, and macromolecular extravasation and matrix deposition as well as associated disorders would be beneficial.

Asymmetric centers exist in the compounds of the present invention. These centers are designated by the symbols "R" or "S," depending on the configuration of substituents around the chiral carbon atom. It should be understood that the invention encompasses all stereochemical isomeric forms, or mixtures thereof, which possess the ability to inhibit one or more protein kinases. Individual stereoisomers of compounds can be prepared synthetically from commercially available starting materials which contain chiral centers or by preparation of mixtures of enantiomeric products followed by separation such as conversion to a mixture of diastereomers followed by separation or recrystallization, chromatographic techniques, or direct separation of enantiomers on chiral chromatographic columns. Starting compounds of particular stereochemistry are either commercially available or can be made and resolved by techniques known in the art.

Because carbon-carbon double bonds exist in the present compounds, the invention contemplates various geometric isomers and mixtures thereof resulting from the arrangement of substituents around these carbon-carbon double bonds. It should be understood that the invention encompasses both isomeric forms, or mixtures thereof, which possess the ability to inhibit one or more protein kinases. These substituents are designated as being in the E or Z configuration wherein the term "E" represents higher order substituents on opposite sides of the carbon-carbon double bond, and the term "Z" represents higher order substituents on the same side of the carbon-carbon double bond.

It should be understood that the terms "administering a" and "administering to," refer to providing a compound of the present invention to a patient in need of treatment.

The patient to be treated can be any animal, and is preferably a mammal, such as a domesticated animal or a livestock animal. More preferably, the patient is a human.

When it is possible that, for use in therapy, therapeutically effective amounts of a compound of formula (I), as well as therapeutically acceptable salts thereof, may be administered as the raw chemical, it is possible to present the active ingredient as a pharmaceutical composition. Accordingly, the invention further provides pharmaceutical compositions, which include therapeutically effective amounts of compounds of formula (I), or therapeutically acceptable salts thereof, and one or more pharmaceutically acceptable

carriers, diluents, or excipients. The compounds of formula (I) and therapeutically acceptable salts thereof are as described above. The carrier(s), diluent(s), or excipient(s) must be acceptable in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient thereof. In accordance with another aspect of the invention
5 there is also provided a process for the preparation of a pharmaceutical formulation including admixing a compound of formula (I), or a therapeutically acceptable salt thereof, with one or more pharmaceutically acceptable carriers, diluents, or excipients.

Pharmaceutical formulations may be presented in unit dose forms containing a predetermined amount of active ingredient per unit dose. Such a unit may contain, for
10 example, 0.5mg to 1g, preferably 1mg to 700mg, more preferably 5mg to 100mg of a compound of formula (I), depending on the condition being treated, the severity of the condition, the time of administration, the route of administration, the rate of excretion of the compound employed, the duration of treatment, and the age, gender, weight, and condition of the patient, or pharmaceutical formulations may be presented in unit dose forms containing a
15 predetermined amount of an active ingredient per dose. Preferred unit dosage formulations are those containing a daily dose or sub-dose, as herein above recited, or an appropriate fraction thereof, of an active ingredient. Furthermore, such pharmaceutical formulations may be prepared by any of the methods well known in the pharmacy art.

Pharmaceutical formulations may be adapted for administration by any appropriate
20 route, for example by the oral (including buccal or sublingual), rectal, nasal, topical (including buccal, sublingual, or transdermal), vaginal, or parenteral (including subcutaneous, intramuscular, intravenous, or intradermal) route. Such formulations may be prepared by any method known in the art of pharmacy, for example by bringing into association the active ingredient with the carrier(s) or excipient(s).

Pharmaceutical formulations adapted for oral administration may be presented as
25 discrete units such as capsules or tablets; powders or granules; solutions or suspensions in aqueous or non-aqueous liquids; edible foams or whips; or oil-in-water liquid emulsions or water-in-oil emulsions.

For instance, for oral administration in the form of a tablet or capsule, the active drug
30 component can be combined with an oral, non-toxic pharmaceutically acceptable inert carrier such as ethanol, glycerol, water, and the like. Powders are prepared by comminuting the compound to a suitable fine size and mixing with a similarly comminuted pharmaceutical carrier such as an edible carbohydrate, as, for example, starch or mannitol. Flavoring, preservative, dispersing, and coloring agent can also be present.

Capsules are made by preparing a powder mixture, as described above, and filling
35 formed gelatin sheaths. Glidants and lubricants such as colloidal silica, talc, magnesium stearate, calcium stearate, or solid polyethylene glycol can be added to the powder mixture before the filling operation. A disintegrating or solubilizing agent such as agar-agar, calcium

carbonate, or sodium carbonate can also be added to improve the availability of the medicament when the capsule is ingested.

Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents, and coloring agents can also be incorporated into the mixture. Suitable binders

5 include starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes, and the like. Lubricants used in these dosage forms include sodium oleate, sodium chloride, and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum, and the like.

10 Tablets are formulated, for example, by preparing a powder mixture, granulating or slugging, adding a lubricant and disintegrant, and pressing into tablets. A powder mixture is prepared by mixing the compound, suitable comminuted, with a diluent or base as described above, and optionally, with a binder such as carboxymethylcellulose, an algininate, gelatin, or polyvinyl pyrrolidone, a solution retardant such as paraffin, a resorption accelerator such as a quaternary salt and/or an absorption agent such as bentonite, kaolin, or dicalcium phosphate. 15 The powder mixture can be granulated by wetting with a binder such as syrup, starch paste, acacia mucilage, or solutions of cellulosic or polymeric materials and forcing through a screen. As an alternative to granulating, the powder mixture can be run through the tablet machine and the result is imperfectly formed slugs broken into granules. The granules can be 20 lubricated to prevent sticking to the tablet forming dies by means of the addition of stearic acid, a stearate salt, talc, or mineral oil. The lubricated mixture is then compressed into tablets. The compounds of the present invention can also be combined with a free flowing inert carrier and compressed into tablets directly without going through the granulating or slugging steps. A clear or opaque protective coating consisting of a sealing coat of shellac, a 25 coating of sugar or polymeric material, and a polish coating of wax can be provided. Dyestuffs can be added to these coatings to distinguish different unit dosages.

Oral fluids such as solution, syrups, and elixirs can be prepared in dosage unit form so that a given quantity contains a predetermined amount of the compound. Syrups can be prepared by dissolving the compound in a suitably flavored aqueous solution, while elixirs 30 are prepared through the use of a non-toxic vehicle. Solubilizers and emulsifiers such as ethoxylated isostearyl alcohols and polyoxyethylene sorbitol ethers, preservatives, flavor additive such as peppermint oil or natural sweeteners, or saccharin or other artificial sweeteners, and the like can also be added.

Where appropriate, dosage unit formulations for oral administration can be 35 microencapsulated. The formulation can also be prepared to prolong or sustain the release as for example by coating or embedding particulate material in polymers, wax, or the like.

The compounds of formula (I), and therapeutically acceptable salts thereof, can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles,

large unilamellar vesicles, and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine, or phosphatidylcholines.

The compounds of formula (I), and therapeutically acceptable salts thereof, may also be delivered by the use of monoclonal antibodies as individual carriers to which the compound molecules are coupled. The compounds may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamidephenol, polyhydroxyethylaspartamidephenol, or polyethyleneoxidepolylysine substituted with palitoyl residues. Furthermore, the compounds may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polyepsilon caprolactone, polyhydroxy butyric acid, polyorthoesters, polyacetals, polydihydropyrans, polycyanoacrylates, and cross-linked or amphipathic block copolymers of hydrogels.

Pharmaceutical formulations adapted for transdermal administration may be presented as discrete patches intended to remain in intimate contact with the epidermis of the recipient for a prolonged period of time. For example, the active ingredient may be delivered from the patch by iontophoresis as generally described in Pharmaceutical Research, 3(6), 318 (1986).

Pharmaceutical formulations adapted for topical administration may be formulated as ointments, creams, suspensions, lotions, powders, solutions, pastes, gels, sprays, aerosols, or oils.

For treatments of the eye or other external tissues, for example mouth and skin, the formulations are preferably applied as a topical ointment or cream. When formulated in an ointment, the active ingredient may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredient may be formulated in a cream with an oil-in-water cream base or a water-in oil base.

Pharmaceutical formulations adapted for topical administrations to the eye include eye drops wherein the active ingredient is dissolved or suspended in a suitable carrier, especially an aqueous solvent.

Pharmaceutical formulations adapted for topical administration in the mouth include lozenges, pastilles, and mouth washes.

Pharmaceutical formulations adapted for rectal administration may be presented as suppositories or as enemas.

Pharmaceutical formulations adapted for nasal administration wherein the carrier is a solid include a coarse powder having a particle size for example in the range 20 to 500 microns which is administered in the manner in which snuff is taken, i.e., by rapid inhalation through the nasal passage from a container of the powder held close up to the nose. Suitable formulations wherein the carrier is a liquid, for administration as a nasal spray or nasal drops, include aqueous or oil solutions of the active ingredient.

Pharmaceutical formulations adapted for administration by inhalation include fine particle dusts or mists, which may be generated by means of various types of metered, dose pressurized aerosols, nebulizers, or insufflators.

Pharmaceutical formulations adapted for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams, or spray formulations.

Pharmaceutical formulations adapted for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats, and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents. The formulations may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules, and tablets.

It should be understood that in addition to the ingredients particularly mentioned above, the formulations may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavoring agents.

A therapeutically effective amount of a compound of the present invention will depend upon a number of factors including, for example, the age and weight of the animal, the precise condition requiring treatment and its severity, the nature of the formulation, and the route of administration, and will ultimately be at the discretion of the attendant physician or veterinarian. However, an effective amount of a compound of formula (I) for the treatment of a protein kinase-mediated condition will generally be in the range of 0.1 to 100 mg/kg body weight of recipient (mammal) per day and more usually in the range of 1 to 10 mg/kg body weight per day.

The compounds of the present invention and therapeutically acceptable salts thereof, may be employed alone or in combination with other therapeutic agents for the treatment of the conditions mentioned herein. For example, in anti-cancer therapy, combination with other chemotherapeutic, hormonal, or antibody agents is envisaged as well as combination with surgical therapy and radiotherapy. Combination therapies according to the present invention thus comprise the administration of at least one compound of formula (I), or a therapeutically acceptable salt thereof, and the use of at least one other cancer treatment method. The compound(s) of formula (I) and the other pharmaceutically active agent(s) may be administered together or separately and when administered separately this may occur simultaneously or sequentially in any order. The amounts of the compound(s) of

formula (I) and the other pharmaceutically active agent(s) and the relative timings of administration will be selected in order to achieve the desired combined therapeutic effect.

The compounds of formula (I), or therapeutically acceptable salts thereof, and at least one additional cancer treatment therapy may be employed in combination concomitantly or sequentially in any therapeutically appropriate combination with such other anti-cancer therapies. In one embodiment, the other anti-cancer therapy is at least one additional chemotherapeutic therapy including administration of at least one anti-neoplastic agent. The administration in combination of a compound of formula (I), or therapeutically acceptable salts thereof, with other anti-neoplastic agents may be in combination in accordance with the invention by administration concomitantly in (1) a unitary pharmaceutical composition including both compounds or (2) separate pharmaceutical compositions each including one of the compounds. Determination of Biological Activity

The in vitro potency of compounds in inhibiting these protein kinases may be
30 determined by the procedures detailed below.

The potency of compounds can be determined by the amount of inhibition of the
phosphorylation of an exogenous substrate (e.g., synthetic peptide (Z. Songyang et al.,
Nature. 373:536-539) by a test compound relative to control.

KDR Tyrosine Kinase Production Using Baculovirus System:

35 The coding sequence for the human KDR intra-cellular domain (aa789-1354) was
generated through PCR using cDNAs isolated from HUVEC cells. A poly-His6 sequence
was introduced at the N-terminus of this protein as well. This fragment was cloned into

transfection vector pVL1393 at the Xba 1 and Not 1 site. Recombinant baculovirus (BV) was generated through co-transfection using the BaculoGold Transfection reagent (PharMingen). Recombinant BV was plaque purified and verified through Western analysis. For protein production, SF-9 cells were grown in SF-900-II medium at 2×10^6 /ml, and were infected at 5 0.5 plaque forming units per cell (MOI). Cells were harvested at 48 hours post infection.

Purification of KDR

SF-9 cells expressing (His)₆KDR(aa789-1354) were lysed by adding 50 ml of Triton X-100 lysis buffer (20 mM Tris, pH 8.0, 137 mM NaCl, 10% glycerol, 1% Triton X-100, 10 1mM PMSF, 10 μ g/ml aprotinin, 1 μ g/ml leupeptin) to the cell pellet from 1L of cell culture. The lysate was centrifuged at 19,000 rpm in a Sorval SS-34 rotor for 30 min at 4 °C. The cell lysate was applied to a 5 ml NiCl₂ chelating sepharose column, equilibrated with 50 mM HEPES, pH7.5, 0.3 M NaCl. KDR was eluted using the same buffer containing 0.25 M imidazole. Column fractions were analyzed using SDS-PAGE and an ELISA assay (below) 15 which measures kinase activity. The purified KDR was exchanged into 25mM HEPES, pH7.5, 25mM NaCl, 5 mM DTT buffer and stored at -80 °C.

Human Tie-2 Kinase Production and Purification

The coding sequence for the human Tie-2 intra-cellular domain (aa775-1124) was generated through PCR using cDNAs isolated from human placenta as a template. A poly- 20 His₆ sequence was introduced at the N-terminus and this construct was cloned into transfection vector pVL 1939 at the Xba 1 and Not 1 site. Recombinant BV was generated through co-transfection using the BaculoGold Transfection reagent (PharMingen). Recombinant BV was plaque purified and verified through Western analysis. For protein 25 production, SF-9 insect cells were grown in SF-900-II medium at 2×10^6 /ml, and were infected at MOI of 0.5. Purification of the His-tagged kinase used in screening was analogous to that described for KDR.

Human Flt-1 Tyrosine Kinase Production and Purification

The baculoviral expression vector pVL1393 (Phar Mingen, Los Angeles, CA) was used. A nucleotide sequence encoding poly-His₆ was placed 5' to the nucleotide region encoding the entire intracellular kinase domain of human Flt-1 (amino acids 786-1338). The nucleotide sequence encoding the kinase domain was generated through PCR using cDNA 30 libraries isolated from HUVEC cells. The histidine residues enabled affinity purification of the protein as a manner analogous to that for KDR and ZAP70. SF-9 insect cells were 35 infected at a 0.5 multiplicity and harvested 48 hours post infection.

EGFR Tyrosine Kinase Source

EGFR was purchased from Sigma (Cat # E-3641; 500 units/50 µL) and the EGF ligand was acquired from Oncogene Research Products/Calbiochem (Cat # PF011-100).

Expression of ZAP70

5 The baculoviral expression vector used was pVL1393. (PharMingen, Los Angeles, Ca.) The nucleotide sequence encoding amino acids M(H)6 LVPR₉S was placed 5' to the region encoding the entirety of ZAP70 (amino acids 1-619). The nucleotide sequence encoding the ZAP70 coding region was generated through PCR using cDNA libraries isolated from Jurkat immortalized T-cells. The histidine residues enabled affinity purification
10 of the protein (vide infra). The LVPR₉S bridge constitutes a recognition sequence for proteolytic cleavage by thrombin, enabling removal of the affinity tag from the enzyme. SF-9 insect cells were infected at a multiplicity of infection of 0.5 and harvested 48 hours post infection.

Extraction and purification of ZAP70

15 SF-9 cells were lysed in a buffer consisting of 20 mM Tris, pH 8.0, 137 mM NaCl, 10% glycerol, 1% Triton X-100, 1 mM PMSF, 1 µg/ml leupeptin, 10 µg/ml aprotinin and 1 mM sodium orthovanadate. The soluble lysate was applied to a chelating sepharose HiTrap column (Pharmacia) equilibrated in 50 mM HEPES, pH 7.5, 0.3 M NaCl. Fusion protein was
20 eluted with 250 mM imidazole. The enzyme was stored in buffer containing 50 mM HEPES, pH 7.5, 50 mM NaCl and 5 mM DTT.

Protein kinase source

25 Lck, Fyn, Src, Blk, Csk, and Lyn, and truncated forms thereof may be commercially obtained (e.g., from Upstate Biotechnology Inc. (Saranac Lake, N.Y) and Santa Cruz Biotechnology Inc. (Santa Cruz, Ca.)) or purified from known natural or recombinant sources using conventional methods.

Enzyme Linked Immunosorbent Assay (ELISA) For PTKs

30 Enzyme linked immunosorbent assays (ELISA) were used to detect and measure the presence of tyrosine kinase activity. The ELISA were conducted according to known protocols which are described in, for example, Voller, et al., 1980, "Enzyme-Linked Immunosorbent Assay," In: Manual of Clinical Immunology, 2d ed., edited by Rose and Friedman, pp 359-371 Am. Soc. of Microbiology, Washington, D.C.

35 The disclosed protocol was adapted for determining activity with respect to a specific PTK. For example, preferred protocols for conducting the ELISA experiments is provided below. Adaptation of these protocols for determining a compound's activity for other members of the receptor PTK family, as well as non-receptor tyrosine kinases, are well

within the abilities of those in the art. For purposes of determining inhibitor selectivity, a universal PTK substrate (e.g., random copolymer of poly(Glu₄ Tyr), 20,000-50,000 MW) was employed together with ATP (typically 5 μ M) at concentrations approximately twice the apparent K_m in the assay.

- 5 The following procedure was used to assay the inhibitory effect of compounds of this invention on KDR, Flt-1, Flt-4, Tie-1, Tie-2, EGFR, FGFR, PDGFR, IGF-1-R, c-Met, Lck, hck, Blk, Csk, Src, Lyn, fgr, Fyn and ZAP70 tyrosine kinase activity:

Cdc2 source

The human recombinant enzyme and assay buffer may be obtained commercially (New England Biolabs, Beverly, MA. USA) or purified from known natural or recombinant sources using conventional methods.

35

Cdc2 Assay

A protocol that can be used is that provided with the purchased reagents with minor modifications. In brief, the reaction is carried out in a buffer consisting of 50mM Tris pH

7.5, 100mM NaCl, 1mM EGTA, 2mM DTT, 0.01% Brij, 5% DMSO and 10mM MgCl₂ (commercial buffer) supplemented with fresh 300 μ M ATP (31 μ Ci/ml) and 30 μ g/ml histone type IIIss final concentrations. A reaction volume of 80 μ L, containing units of enzyme, is run for 20 minutes at 25 degrees C in the presence or absence of inhibitor. The reaction is terminated by the addition of 120 μ L of 10% acetic acid. The substrate is separated from unincorporated label by spotting the mixture on phosphocellulose paper, followed by 3 washes of 5 minutes each with 75mM phosphoric acid. Counts are measured by a betacounter in the presence of liquid scintillant.

PKC kinase source

The catalytic subunit of PKC may be obtained commercially (Calbiochem).

PKC kinase assay

A radioactive kinase assay is employed following a published procedure (Yasuda, I., Kirshimoto, A., Tanaka, S., Tominaga, M., Sakurai, A., Nishizuka, Y. Biochemical and Biophysical Research Communication 3:166, 1220-1227 (1990)). Briefly, all reactions are performed in a kinase buffer consisting of 50 mM Tris-HCl pH7.5, 10mM MgCl₂, 2mM DTT, 1mM EGTA, 100 μ M ATP, 8 μ M peptide, 5% DMSO and ³³P ATP (8Ci/mM). Compound and enzyme are mixed in the reaction vessel and the reaction is initiated by addition of the ATP and substrate mixture. Following termination of the reaction by the addition of 10 μ L stop buffer (5 mM ATP in 75mM phosphoric acid), a portion of the mixture is spotted on phosphocellulose filters. The spotted samples are washed 3 times in 75 mM phosphoric acid at room temperature for 5 to 15 minutes. Incorporation of radiolabel is quantified by liquid scintillation counting.

Erk2 enzyme source

The recombinant murine enzyme and assay buffer may be obtained commercially (New England Biolabs, Beverly MA. USA) or purified from known natural or recombinant sources using conventional methods.

Erk2 enzyme assay

In brief, the reaction is carried out in a buffer consisting of 50 mM Tris pH 7.5, 1mM EGTA, 2mM DTT, 0.01% Brij, 5% DMSO and 10 mM MgCl₂ (commercial buffer) supplemented with fresh 100 μ M ATP (31 μ Ci/ml) and 30 μ M myelin basic protein under conditions recommended by the supplier. Reaction volumes and method of assaying incorporated radioactivity are as described for the PKC assay (vide supra).

Cellular Receptor PTK Assays

The following cellular assay was used to determine the level of activity and effect of the different compounds of the present invention on KDR/VEGFR2. Similar receptor PTK assays employing a specific ligand stimulus can be designed along the same lines for other tyrosine kinases using techniques well known in the art.

5 VEGF-Induced KDR Phosphorylation in Human Umbilical Vein Endothelial Cells (HUVEC) as Measured by Western Blots:

1. HUVEC cells (from pooled donors) can be purchased from Clonetics (San Diego, CA) and cultured according to the manufacturer directions. Only early passages (3-8) are used for this assay. Cells are cultured in 100 mm dishes (Falcon for tissue culture; Becton
10 Dickinson; Plymouth, England) using complete EBM media (Clonetics).

2. For evaluating a compound's inhibitory activity, cells are trypsinized and seeded at $0.5-1.0 \times 10^5$ cells/well in each well of 6-well cluster plates (Costar; Cambridge, MA).

3. 3-4 days after seeding, plates are typically 90-100% confluent. Medium is
15 removed from all the wells, cells are rinsed with 5-10ml of PBS and incubated 18-24h with 5ml of EBM base media with no supplements added (i.e., serum starvation).

4. Serial dilutions of inhibitors are added in 1ml of EBM media (25 μ M, 5 μ M, or 1 μ M final concentration to cells and incubated for one hour at 37 °C. Human recombinant VEGF₁₆₅ (R & D Systems) is then added to all the wells in 2 ml of EBM medium at a final
20 concentration of 50ng/ml and incubated at 37 °C for 10 minutes. Control cells untreated or treated with VEGF only are used to assess background phosphorylation and phosphorylation induction by VEGF.

All wells are then rinsed with 5-10ml of cold PBS containing 1mM Sodium Orthovanadate (Sigma) and cells are lysed and scraped in 200 μ l of RIPA buffer (50mM Tris-HCl)
25 pH7, 150mM NaCl, 1% NP-40, 0.25% sodium deoxycholate, 1mM EDTA) containing protease inhibitors (PMSF 1mM, aprotinin 1 μ g/ml, pepstatin 1 μ g/ml, leupeptin 1 μ g/ml, Na vanadate 1mM, Na fluoride 1mM) and 1 μ g/ml of Dnase (all chemicals from Sigma Chemical Company, St Louis, MO). The lysate is spun at 14,000 rpm for 30min, to eliminate nuclei.

Equal amounts of proteins are then precipitated by addition of cold (-20 °C) Ethanol
30 (2 volumes) for a minimum of 1 hour or a maximum of overnight. Pellets are reconstituted in Laemli sample buffer containing 5% -mercaptoethanol (BioRad; Hercules, CA) and boiled for 5min. The proteins are resolved by polyacrylamide gel electrophoresis (6%, 1.5mm Novex, San Deigo, CA) and transferred onto a nitrocellulose membrane using the Novex system. After blocking with bovine serum albumin (3%), the proteins are probed overnight
35 with anti-KDR polyclonal antibody (C20, Santa Cruz Biotechnology; Santa Cruz, CA) or with anti-phosphotyrosine monoclonal antibody (4G10, Upstate Biotechnology, Lake Placid, NY) at 4 °C. After washing and incubating for 1 hour with HRP-conjugated F(ab)₂ of goat

anti-rabbit or goat-anti-mouse IgG the bands are visualized using the emission chemiluminescence (ECL) system (Amersham Life Sciences, Arlington Heights, IL).

In vivo Uterine Edema Model

This assay measures the capacity of compounds to inhibit the acute increase in uterine weight in mice which occurs in the first few hours following estrogen stimulation. This early onset of uterine weight increase is known to be due to edema caused by increased permeability of uterine vasculature. Cullinan-Bove and Koss (Endocrinology (1993), 133:829-837) demonstrated a close temporal relationship of estrogen-stimulated uterine edema with increased expression of VEGF mRNA in the uterus. These results have been confirmed by the use of neutralizing monoclonal antibody to VEGF which significantly reduced the acute increase in uterine weight following estrogen stimulation (WO 97/42187). Hence, this system can serve as a model for in vivo inhibition of VEGF signalling and the associated hyperpermeability and edema.

Materials: All hormones can be purchased from Sigma (St. Louis, MO) or Cal Biochem (La Jolla, CA) as lyophilized powders and prepared according to supplier instructions. Vehicle components (DMSO, Cremaphor EL) can be purchased from Sigma (St. Louis, MO). Mice (Balb/c, 8-12 weeks old) can be purchased from Taconic (Germantown, NY) and housed in a pathogen-free animal facility in accordance with institutional Animal Care and Use Committee Guidelines.

Method:

Day 1: Balb/c mice are given an intraperitoneal (i.p.) injection of 12.5 units of pregnant mare's serum gonadotropin (PMSG).

Day 3: Mice receive 15 units of human chorionic gonadotropin (hCG) i.p.

Day 4: Mice are randomized and divided into groups of 5-10. Test compounds are administered by i.p., i.v. or p.o. routes depending on solubility and vehicle at doses ranging from 1-100 mg/kg. Vehicle control group receive vehicle only and two groups are left untreated.

Thirty minutes later, experimental, vehicle and 1 of the untreated groups are given an i.p. injection of 17 β -estradiol (500 mg/kg). After 2-3 hours, the animals are sacrificed by CO₂ inhalation. Following a midline incision, each uterus was isolated and removed by cutting just below the cervix and at the junctions of the uterus and oviducts. Fat and connective tissue were removed with care not to disturb the integrity of the uterus prior to weighing (wet weight). Uteri are blotted to remove fluid by pressing between two sheets of filter paper with a one liter glass bottle filled with water. Uteri are weighed following blotting (blotted weight). The difference between wet and blotted weights is taken as the fluid content of the uterus. Mean fluid content of treated groups is compared to untreated or vehicle treated

groups. Significance is determined by Student's test. Non-stimulated control group is used to monitor estradiol response.

Certain compounds of this invention which are inhibitors of angiogenic receptor tyrosine kinases can also be shown active in a Matrigel implant model of neovascularization.

5 The Matrigel neovascularization model involves the formation of new blood vessels within a clear marble of extracellular matrix implanted subcutaneously which is induced by the presence of proangiogenic factor producing tumor cells (for examples see: Passaniti, A., et al, Lab. Investig. (1992), 67(4), 519-528; Anat. Rec. (1997), 249(1), 63-73; Int. J. Cancer (1995), 63(5), 694-701; Vasc. Biol. (1995), 15(11), 1857-6). The model preferably runs over
10 3-4 days and endpoints include macroscopic visual/image scoring of neovascularization, microscopic microvessel density determinations, and hemoglobin quantitation (Drabkin method) following removal of the implant versus controls from animals untreated with inhibitors. The model may alternatively employ bFGF or HGF as the stimulus.

The compounds of the present invention may be used in the treatment of protein
15 kinase-mediated conditions, such as benign and neoplastic proliferative diseases and disorders of the immune system. Such diseases include autoimmune diseases, such as rheumatoid arthritis, thyroiditis, type 1 diabetes, multiple sclerosis, sarcoidosis, inflammatory bowel disease, Crohn's disease, myasthenia gravis and systemic lupus erythematosus; psoriasis, organ transplant rejection (e.g., kidney rejection, graft versus host disease), benign
20 and neoplastic proliferative diseases, human cancers such as lung, breast, stomach, bladder, colon, pancreatic, ovarian, prostate and rectal cancer and hematopoietic malignancies (leukemia and lymphoma), glioblastoma, infantile hemangioma, and diseases involving inappropriate vascularization (for example diabetic retinopathy, retinopathy of prematurity, choroidal neovascularization due to age-related macular degeneration, and infantile
25 hemangiomas in human beings). Such inhibitors may be useful in the treatment of disorders involving VEGF mediated edema, ascites, effusions, and exudates, including for example macular edema, cerebral edema, acute lung injury and adult respiratory distress syndrome (ARDS). In addition, the compounds of the invention may be useful in the treatment of pulmonary hypertension, particularly in patients with thromboembolic disease (J. Thorac.
30 Cardiovasc. Surg. 2001, 122 (1), 65-73).

The compounds and processes of the present invention will be better understood in connection with the following synthetic schemes which illustrate the methods by which the compounds of the invention may be prepared. Starting materials can be obtained from commercial sources or prepared by well-established literature methods known to those of ordinary skill in the art.

The reactions are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformations being effected. It will be understood by those skilled in the art of organic synthesis that the functionality present on the molecule should be consistent with the transformations proposed. This will sometimes require a judgment to modify the order of the synthetic steps or to select one particular process scheme over another in order to obtain a desired compound of the invention.

It will also be recognized that another major consideration in the planning of any synthetic route in this field is the judicious choice of the protecting group used for protection of the reactive functional groups present in the compounds described in this invention. An authoritative account describing the many alternatives to the trained practitioner is Greene and Wuts (Protective Groups In Organic Synthesis, Wiley and Sons, 1999). Suitable protecting groups include, but are not limited to, tert-butoxycarbonyl (BOC), trimethylsilyl ethanesulfonamide (SES), benzyloxycarbonyl (CBZ) and benzyl (Bn) protecting groups. The BOC protecting group may be removed by treatment with an acid such as trifluoroacetic acid or concentrated hydrochloric acid and the SES protecting group may be removed with a fluoride salt, such as cesium fluoride or tetrabutylammonium fluoride. The CBZ and Bn protection groups may be removed by catalytic hydrogenation. Additional suitable protecting groups for hydroxy substituents include, but are not limited to, t-butyldimethylsilyl (TBDMS), tetrahydropyranyl (THP), or isopropyl (i-Pr) protecting groups. The TBDMS and THP protecting groups may be removed by treatment with an acid such as acetic acid or hydrochloric acid while the i-Pr protecting group may be removed by aluminum trichloride.

This invention is intended to encompass compounds having formula (I) when prepared by synthetic processes or by metabolic processes. Preparation of the compounds of the invention by metabolic processes include those occurring in the human or animal body (in vivo) or processes occurring in vitro.

The groups R^1 , R^2 , R^3 , R^4 , and R^5 are as defined above unless otherwise noted below.

Scheme 1

Scheme 1 shows the synthesis of compounds of formula (6). Compounds of formula (3) can be reacted with ethyl (diethoxyphosphino)acetate in the presence of a base such as sodium hydride, LDA, or lithium hexamethyldisilazide to provide compounds of formula (4). This reaction is typically conducted at about 0 to about 25 °C for about 1 to about 6 hours.

Alternatively, compounds of formula (3) can be treated with malonic acid in the presence of pyridine and piperidine to provide compounds of formula (4). The reaction is typically conducted at about 90 to about 110 °C for about 6 to about 18 hours.

Compounds of formula (4) can be converted to compounds of formula (5) by treatment with thionyl chloride and DMF followed by treatment with sodium azide and subsequent heating. The reaction is conducted at about 30 to about 260 °C for about 5 to about 10 hours.

Conversion of compounds of formula (5) to compounds of formula (6) can be accomplished by treatment with POCl₃ at about 108 °C for about 1 to about 4 hours followed by treatment with ammonia under pressure at about 140 to about 160 °C.

Scheme 2

Compounds of formula (Ia) can be synthesized by the methods shown in Scheme 2.

Compounds of formula (6) can be converted to compounds of formula (8) by transition metal-mediated cross-coupling with compounds of formula (7) (q is 1 or 2 and each R^x is independently selected from the group consisting of alkoxy, alkyl, aryl, cyano, halo, haloalkoxy, haloalkyl, heteroaryl, heterocyclyl, hydroxy, hydroxyalkyl, and NR^aR^b) in the presence of bis(pinacolato)diboron, potassium acetate, and a base. Examples of transition metal catalysts used in these couplings include, but are not limited to, PdCl₂(dppf), Pd(PPh₃)₄, and Pd(PPh₃)₂Cl₂. Representative bases include sodium carbonate, potassium carbonate, and

cesium carbonate. The reaction is typically conducted at about 70 to about 90 °C for about 2 to about 24 hours.

Compounds of formula (8) can be converted to compounds of formula (Ia) (where L is selected from the group consisting of $\text{NR}^5\text{C}(\text{O})(\text{CH}_2)_m$, NR^5SO_2 , $(\text{CH}_2)_m\text{N}(\text{R}^5)\text{C}(\text{O})\text{N}(\text{R}^6)(\text{CH}_2)_n$) by treatment with the appropriate acylating/sulfonylating reagent (i.e., a substituted acid chloride, sulfonyl chloride, or isocyanate) optionally in the presence of a base such as pyridine or triethylamine.

Scheme 3

As shown in Scheme 3, compounds of formula (6) can be reacted with compounds of formula (9) (where q is 1, 2, or 3 and each R^Y is selected from the group consisting of alkoxy, alkyl, aryl, cyano, halo, haloalkoxy, haloalkyl, heteroaryl, heterocyclyl, hydroxy, hydroxyalkyl, LR^4 , and NR^aR^b ; provided that at least two of the three substituents are other than LR^4) in the presence of a transition metal catalyst and a base to provide compounds of formula (Ia). Examples of transition metal catalysts used in these couplings include, but are not limited to, $\text{PdCl}_2(\text{dppf})$, $\text{Pd}(\text{PPh}_3)_4$, and $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$. Representative bases include sodium carbonate, potassium carbonate, and cesium carbonate.

Scheme 4

Compounds of formula (Ic) can be synthesized following the procedures shown in Scheme 4. Compounds of formula (Ia) or (Ib) can be reacted with N-iodosuccinimide at about 20 to about 35 °C for about 1 to about 4 hours to provide compounds of formula (10).

Compounds of formula (Ic) can be prepared by coupling compounds of formula (10) with an appropriately substituted organometallic coupling partner (for example, an organoborane or an organostannane) in the presence of a transition metal catalyst. Examples of transition metal catalysts used in these couplings include, but are not limited to, $\text{PdCl}_2(\text{dppf})$, $\text{Pd}(\text{PPh}_3)_4$, and $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$. When an organoborane is used in the coupling, a

base is also required. Representative bases include sodium carbonate, potassium carbonate, and cesium carbonate.

Compounds of formula (Ic) can be further functionalized at R¹ using methods known to those of ordinary skill in the art. For example, when R¹ contains an aldehyde (formed by coupling an alkenyl acetal with the compound of formula (10) and subsequent deprotection) reductive amination provides an alkenylamine. Similarly, when R¹ contains a primary amine, reaction with an aldehyde under reductive amination provides the secondary amine. In another example, when R¹ contains a carboxylic acid (prepared by hydrolysis of the corresponding ester) coupling with an amine provides an alkenylamide.

Scheme 5

The synthesis of compounds of formula (Id) is shown in Scheme 5. Compounds of formula (5) can be treated with nitric acid and sulfuric acid to provide compounds of formula (11). Conversion of the pyridone to the aminopyridine can be accomplished using the conditions described in Scheme 1. Protection of the amine followed by reduction of the nitro group using conditions known to those of ordinary skill in the art provides compounds of formula (12) where P is a nitrogen protecting group. The unprotected amine can be further functionalized by reacting with an appropriately substituted acyl halide, sulfonyl chloride, or isocyanate to provide compounds of formula (13) where R^v is the resulting functionality (i.e., alkylsulfonyl, alkylcarbonyl). Removal of the protecting group followed by coupling of the bromide as described in Scheme 2 or Scheme 3 provides compounds of formula (Id).

Scheme 6

As shown in Scheme 6, compounds of formula (14) (prepared according to the procedures described in Scheme 1 using 1-(4-bromo-2-thienyl)ethanone) can be converted to compounds of formula (15) by treatment with POCl₃ at about 108 °C for about 1 to about 4 hours. Reaction of compounds of formula (15) with benzoyl peroxide and N-bromosuccinimide followed by treatment with sodium acetate provides compounds of formula (16). This reaction is typically conducted at about 70 to about 100 °C for about 24 to about 48 hours.

Removal of the acetate group and displacement of the chloride can be accomplished by treating compounds of formula (16) with concentrated ammonium hydroxide at a temperature of about 120 to about 160 °C to provide compounds of formula (17). Coupling of the bromide using the conditions described in Schemes 2 or 3 and further functionalization of the hydroxymethyl group provides compounds of formula (I). An example of further functionalization is oxidation of the hydroxymethyl group to provide the aldehyde followed by reductive amination to provide an aminomethyl group.

4-bromo-2-methoxyaniline

A mixture of o-anisidine (27.1g, 219 mmol) and dichloromethane (500 mL) was stirred under an atmosphere of nitrogen and treated with 2,4,4,6-tetrabromo-2,5-cyclohexadienone (90.0g, 219 mmol) in four roughly equal portions over the course of 20 minutes. The temperature of the reaction was maintained between 10 and 15 °C by cooling with a cold water bath during the addition of the 2,4,4,6-tetrabromo-2,5-cyclohexadienone. The mixture was warmed to ambient temperature and stirred for an additional 1.5 hours at which time HPLC [Hypersil HS C18, 5 μm, 100Å, 250 x 4.6 mm; 25-100% acetonitrile/0.1M ammonium acetate over 10 minutes, 1mL/min] o-anisidine t_r=7.63 min, 4-bromo-2-methoxyaniline R_t = 9.77 min] indicated very little o-anisidine remaining. The mixture was

washed with 0.67N NaOH (300 mL) and 1N aqueous sodium hydroxide (300 mL). The combined aqueous washes were extracted with dichloromethane (150 mL) and the combined organic solutions were then washed with water (2 x 200 mL) and brine (200 mL), dried (MgSO₄), filtered, and concentrated to provide about 48g of the desired product.

HPLC (using the conditions from Example 175A, product R_t = 13.55 min and TLC (8:2 heptane/ethyl acetate, R_f of product = 0.53, R_f of 4-bromo-2-methoxyaniline = 0.27) indicated approximately 10% starting material was remaining. Additional di-tert-butyl dicarbonate (3.9g, 18 mmol) was added and heating was continued for another 5 hours. The mixture was cooled and evaporated under reduced pressure. The residue was applied to a 400 gram silica gel column and eluted with 8:2 heptane/ethyl acetate. The fractions showing the desired product were combined and washed with saturated NaHCO₃ and then brine. The organic solution was dried (MgSO₄), filtered, and concentrated to provide 61.3g of a mixture of the desired product and di-tert-butyl dicarbonate which was used directly in the next step.

General Procedure for Reductive Aminations with Example 176C

A mixture of Example 176C (40 mg, 0.083 mmol), sodium triacetoxyborohydride (35 mg, 0.166 mmol) and the appropriate amine (0.166 mmol) in 1,2-dichloromethane (2 mL) was stirred for 2 to 72 hours at ambient temperature. The mixture was concentrated and the residue was purified by normal or reverse phase chromatography. Where necessary a Boc-protected diamine was used for the reductive amination then the protecting group was removed by stirring the reaction mixture in a 2:1 mixture of acetone and 6N hydrochloric acid for 2 hours followed by concentration and purification of the residue.

The following examples were prepared by this general method using the indicated amines:

General Procedure A

A mixture of a boronate ester or a boronic acid (1–5 equivalents, preferably 1-1.5 equivalents), a halide (for example a bromide or an iodide, preferably an iodide) (preferably 1.0 equivalent) and a base (for example, sodium carbonate or cesium carbonate, preferably sodium carbonate) (1–10 equivalents, preferably 2-3 equivalents) is heated in a mixture of an organic solvent (for example, ethylene glycol dimethyl ether, N,N-dimethylformamide, or toluene, preferably ethylene glycol dimethyl ether) and water at about 20–150 °C (preferably about 80-95 °C). A palladium catalyst (for example, palladium(II) acetate, tris(dibenzylideneacetone)dipalladium(0), tetrakis(triphenylphosphine)palladium(0), preferably tetrakis(triphenylphosphine)-palladium(0)) (0.01–0.2 equivalents, preferably 0.05-0.09 equivalents) is added and the reaction mixture is allowed to stir for about 1–48 hours (preferably about 2-18 hours) under an inert atmosphere. The mixture is allowed to cool to ambient temperature and the solvents are removed under reduced pressure. The residue is partitioned between water and an organic solvent, the organic layer is separated and the aqueous layer is further extracted with organic solvent. The combined organic extracts are dried over a desiccant. The solvents are evaporated under reduced pressure to afford the product that can be further purified by crystallization or chromatography.

General Procedure B

To a suspension of the appropriate aldehyde or ketone substrate and a primary or secondary amine (1 – 10 eq, preferably 1-4 equivalents) in an organic solvent (for example dichloromethane, ethyl acetate, N,N-dimethylformamide or dichloroethane, preferably dichloroethane) was added sodium triacetoxy borohydride (1– 10 equivalents, preferably 1-2 equivalents). The resulting solution was allowed to stir at room temperature for 2 – 20 hours. Acetic acid (catalytic – 10 equivalents, preferably 1 drop to 4 equivalents) was added to progress the reaction when necessary. Upon completion, the reaction solution was treated with an aqueous solution of an appropriate base (sodium hydroxide, sodium bicarbonate, or sodium carbonate preferably sodium bicarbonate) and dichloromethane. International application No.
PCT/US2004/024003

Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 24-28 (part)
because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 24-28 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
